GAME DEVELOPMENT PROMPT: COOLIO THE RABBIT VERSUS THE WORLD

The Concept

We're creating a chaotic, darkly comedic 3D action shooter called Coolio the Rabbit versus the World.

You play as Coolio, a small rabbit who walks upright like a human, dresses like a gangster, and is permanently pissed off at the entire world. He's cute enough to fit in your hands, but he's got the attitude of someone who's been personally betrayed by every living thing on the planet.

Coolio has finally had enough.

Armed with a submachine gun, an oversized ego, and an explosive temper, he fights his way through a hostile world full of enemies, ridiculous situations, and absurd levels of chaos.

The game should feel like a mix of an over-the-top third-person shooter, a crime-comedy cartoon, and a ridiculous fever dream.

1. Core Gameplay

Build a playable 3D third-person action game featuring:

A playable rabbit protagonist: Coolio is a small, expressive rabbit who walks, runs, jumps, aims, shoots, dodges, and reloads while standing on two feet.

Third-person camera: The camera follows Coolio from behind, slightly above shoulder level, giving the player a clear view of the action.

Gunplay: Coolio carries a stylized submachine gun with firing animations, muzzle flashes, projectile effects, sound effects, and reload mechanics.

Enemy AI: Enemies patrol areas, notice the player, chase him, take cover when appropriate, and attack when he enters combat.

Combat system: Include health, damage, enemy reactions, hit effects, and a death or restart system.

Movement: Responsive movement with sprinting, jumping, dodging, and smooth turning.

Destructible chaos: Add breakable props, flying objects, debris, and environmental reactions wherever practical.

Progression: Defeating enemies and reaching objectives allows Coolio to move into new areas and encounter increasingly ridiculous challenges.

Keep the controls responsive and the action immediately fun.

2. The Main Character: Coolio the Rabbit

Coolio is the star of the show. His personality and visual identity are essential.

Appearance:

Small rabbit body with long ears, expressive eyes, and exaggerated facial expressions.

Walks upright on two legs.

Oversized streetwear: baggy hoodie, loose pants, chunky sneakers, gold chain, and sunglasses.

Carries a stylized submachine gun that looks slightly oversized in his small hands.

Bouncy rabbit movement combined with confident, aggressive gangster swagger.

Personality:

Permanently annoyed.

Overconfident despite being a tiny rabbit.

Sarcastic, unpredictable, and darkly funny.

Reacts to danger with anger rather than fear.

Occasionally makes ridiculous comments during combat.

Coolio should look simultaneously adorable, intimidating, and completely ridiculous.

Give him distinctive animations: twitching ears when annoyed, stomping when angry, exaggerated reloads, smug victory poses, and dramatic reactions when hit.

3. The World

The setting should be a stylized modern city with a gritty urban atmosphere.

Include environments such as:

Graffiti-covered streets and alleyways.

Convenience stores and parking lots.

Rooftops and fire escapes.

Industrial yards and abandoned warehouses.

Neon-lit streets at night.

Police barricades and chaotic urban encounters.

The city should feel alive without requiring a massive open world. Start with one compact, detailed level that can be completed and expanded later.

Use exaggerated proportions, colorful lighting, graffiti, urban props, and environmental storytelling to make the world memorable.

4. The Enemies

The world is against Coolio.

Create several enemy types with different behaviors:

Street Enforcers: Basic enemies who chase Coolio and attack when they spot him.

Tactical Units: Better-equipped enemies who take cover and coordinate their attacks.

Police Units: Fictional law-enforcement enemies who pursue Coolio, establish roadblocks, and attempt to stop his rampage.

Heavy Enemies: Large, heavily armored opponents who require more effort to defeat.

Mini-Bosses: Distinctive characters with unique appearances, attack patterns, and dialogue.

The enemies should be threatening enough to create fun combat, but their animations and reactions should also be funny.

Give enemies simple, reliable AI first. Improve their intelligence only after the basic game works.

5. Tone and Humor

The tone is crucial.

This is a deliberately over-the-top, irreverent, chaotic action comedy. It should never take itself too seriously.

Think:

A tiny rabbit behaving like the most dangerous gangster alive.

Dramatic cinematic moments interrupted by stupid rabbit behavior.

Enemies panicking because a furious rabbit is charging straight at them.

Ridiculous dialogue, absurd situations, exaggerated physics, and unexpected visual jokes.

A gritty urban aesthetic contrasted with a cartoonishly small protagonist.

The game can include fictional criminal organizations, corrupt officials, absurd authority figures, and exaggerated action-movie tropes.

Use original dialogue and original music. Give Coolio a memorable personality rather than making him a generic silent shooter protagonist.

6. Weapons and Combat Feedback

Start with one functional weapon: Coolio's submachine gun.

Implement:

Automatic firing while the fire button is held.

Ammunition and reloading.

Muzzle flashes and impact effects.

Recoil and camera feedback.

Enemy hit reactions.

Optional weapon spread and aiming.

Clear audio and visual feedback for every shot.

Later, add unlockable weapons, alternate firing modes, weapon upgrades, and ridiculous special abilities.

Make every combat encounter feel responsive and satisfying without overwhelming the player with complicated systems.

7. Game Modes and Objectives

The first playable version should be a single-player campaign prototype.

Create a first mission called "Wrong Rabbit, Wrong Day."

The mission begins with Coolio walking down a city street when a ridiculous incident pushes him over the edge. The situation escalates into a chaotic confrontation with waves of enemies.

The player must:

Learn the movement and aiming controls.

Fight through the opening encounter.

Survive progressively tougher enemy waves.

Navigate the environment and reach an extraction point.

Face a memorable mini-boss encounter.

Complete the mission with a ridiculous victory sequence.

Include a simple main menu, pause menu, health display, ammunition counter, objective indicator, and mission-completion screen.

Make the game playable from beginning to end, even if the initial version uses placeholder art.

8. Visual Direction

Use a stylized 3D art direction rather than realistic human violence.

Aim for:

Expressive cartoon characters.

High-quality stylized lighting.

Detailed urban environments.

Exaggerated animation and ragdoll physics.

Bold colors, graffiti, and dramatic shadows.

Cinematic camera work during key moments.

Coolio should be visually recognizable from a distance. His ears, silhouette, outfit, and swagger should make him stand out immediately.

Use fictional branding and original character designs.

9. Technical Implementation

Choose the most appropriate technology for delivering a genuinely playable prototype.

If building for the browser, consider Three.js or another suitable 3D framework. If using a game engine, choose an appropriate engine and explain the reasoning briefly.

Prioritize:

A working 3D scene.

A controllable rabbit character.

A functioning third-person camera.

Working movement and jumping.

A functioning weapon and firing system.

Enemies that can detect and pursue the player.

Health, damage, and defeat mechanics.

A complete first mission.

A simple user interface.

Sound, animation, polish, and optimization.

Use modular, maintainable code. Keep systems separated so the game can be expanded without rewriting everything.

If full 3D character models or animations are unavailable, create convincing procedural or placeholder alternatives. Do not let missing assets prevent the game from becoming playable.

10. How I Want You to Work

Act as the lead game developer, gameplay programmer, technical designer, and creative director.

Do not respond with only a game design document, a list of suggestions, or a tutorial explaining how I could build it myself.

Actually build the game.

Start by selecting the appropriate technology, then create the project structure and implement a playable prototype.

Work in this order:

Phase 1: Create the 3D world and a controllable Coolio character.

Phase 2: Implement the third-person camera, movement, aiming, shooting, and reloading.

Phase 3: Add enemies, AI, health, damage, and combat feedback.

Phase 4: Build the first mission, objectives, user interface, and win/lose conditions.

Phase 5: Add animations, sound effects, visual polish, and personality.

Phase 6: Test the entire gameplay loop, identify bugs, and fix them.

At every stage, prioritize functional gameplay over elaborate descriptions or unnecessary architecture.

If you have access to a coding environment, create and run the project there. If you can build a playable browser game, make it launchable and easy to test. If you cannot directly run the project, provide all required source files and exact instructions for running them.

Do not claim that something works unless you have verified it. If you encounter a technical limitation, implement the best working alternative and explain the limitation briefly.

Make sensible creative decisions without constantly asking me to choose between minor options.

Final Vision

Coolio the Rabbit versus the World should feel like a game that absolutely should not exist, but somehow does.

It's a tiny rabbit against an entire hostile world. He's got a ridiculous attitude, an outrageous outfit, a gun, and absolutely no intention of calming down.

Make it chaotic. Make it funny. Make it stylish. Make the combat satisfying. Give Coolio a personality players will remember.

Most importantly, make it playable.

Let's build the damn game.

Theres a folder on my desktop called COOLIO , use that for it
